

Scottish Sea Farms Ltd. Sea lice figures for June 2018.

Control of sea lice is based on Integrated Sea Lice Management (ISLM) with prevention as our core strategy and use of the latest non-medicinal approaches including lice shields and biological control with cleanerfish.

Sea lice are counted weekly on every farm following the Code of Good Practice for Scottish finfish aquaculture. The adult females are presented as monthly average (per fish) in the table below. As the figures are reported by calendar month, some months include five full weeks and some include four full weeks to cover the 52 weeks of the year.

Notes to support the table:

"Fallow" = the farm was fallow or empty throughout the entire reporting month.

"Farm stocked in month" = the farm was fallow or empty at the start of the month but was restocked during the month.

"Farm fallowed in month" = the farm was stocked at the start of the month but became fallow or empty during that month.

"No count – harvesting" = fish were being harvested throughout the month. Under such circumstances it is not always possible to record the lice count.

"Below threshold" = Code of Good Practice suggested treatment threshold of 0.5 adult female (1st February to 30th June) or 1.0 adult female (1st July to 31st January).
